The peptides ANAJ7001-B37058 represent examples CC of the peptide portion of the conjugate. The peptides conjugate is cof a Bcl-2 superfamily polypeptide corresponding to amino acids 72-97 of CC the Bij domain of the cell death agonist Bad. The peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for ceversing B cell lymphoma/leukemia 2 (Bcl-2)-mediated blockage of function. In particular, the peptide conjugate is sueful for treating a CC subject afflicted with a cancer characterized by cancer cells that CC express Bcl-2. The cancer includes prostate, colorectal, gastric, cono-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurobegenerative disorders, acquired conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurobegenerative disorders, acquired conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurobegenerative disorders, acquired

treating neurodegenerative disorders, stroke, or cancer ptide conjugates for modulating apoptosis or for inhibiting B ymphoma/leukemia 2 (Bol-2) function, especially useful for

Claim 18; Page 19; 74pp; English.

CC (RX)n-peptide where n = 1:10; X = C=0, when the R-X group is attached cc to the Nterminus of the peptide, or a side chain of the peptide where cc the functional group of the side chain is NH2 or OH, or X = O or NH, when the R-X group is attached to the C-terminus of the peptide, or a side chain of the peptide, or a cc side chain of the peptide, where the side chain functional group is COOH cor COOH2; and R = 2:18C alkyl or alkoxy, 2:14C alkylsely containing one cc when the R-X group is COOH cc rtwo double bonds, cyclobutyl, cyclopentyl, cyclobexyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group or benzyl. The peptides ABAS7001-B37058 represent examples cc fit peptide portion of the conjugate. The peptides represent analogues cc of a Bc1-2 superfamily polypeptide corresponding to amino acids 72-97 of ct the BH3 domain of the cell death agonist Bad. The peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for creversing B cell lymphoma/leukemia 2 (Bc1-2)-mediated blockage of apoptosis in cancer cells. It is also useful for inhibiting Bc1-2 con-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or conjugate is also useful for treating a cute or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a peptide conjugate having the formula:

(R X)n-peptide where n = 1-10; X = Ce-0, when the RX group is attached to the N-terminus of the peptide, or a side chain of the peptide where ct the functional group of the side chain of the peptide, or a side chain of the peptide of the cannothed chain alkyl group, or benzyl. The peptides AB37001 Paptides represent analogues of the peptide of the conjugate is set of the peptide on the conjugate. The peptide conjugate is confused that a some that a subject, or for the side of the peptide of the conjugate is confused that a some that a subject, or for constitution of the conjugate is useful for modulating apoptosis in the cells of a subject, or for confused afflicted with a cancer conjugate is useful for treating a conjugate afflicted with a cancer characterized by cancer cells that cancer characterized by cancer cells t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The invention relates to a peptide conjugate having the formula:

(C (RX)n peptide where n = 1-10; X = C=0, when the R-X group is attached to the N-terminus of the peptide, or a side chain of the peptide where the functional group of the spetide, or a side chain of the peptide, or a side chain functional group is attached to the C-terminus of the peptide, or a side chain functional group is containing one conformation of the peptide, where the side chain functional group is COOH COOHEZ; and R = 2-BC alkyl or alkoxy, 2-14C alkylenyl containing one correctly and R = 2-BC alkyl or alkoxy, 2-14C alkylenyl containing one correctly and the peptide, or a consubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides anabyroll-B37058 represent examples of the peptide portion of the conjugate. The peptides represent examples cof a Bcl-2 superfamily polypeptide corresponding to amino acids 72-97 of the BH3 domain of the cell death agonist BHd. The peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for reversing B cell lymphoma/leukemia 2 (Bcl-2)-mediated blockage of apoptosis in cancer cells. It is also useful for inhibiting Bcl-2 subject afflicted with a cancer characterized by cancer cells that carner should be conjugate is subject to the cancer includes prostate, colorectal gastric conjugate is also useful for treating a cute or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders characterized by concered apoptosis, e.g. neurodegenerative disorders, acquired conjugate is also useful for treating a subject afflicted with a cancer characterized by concered apoptosis, e.g. neurodegenerative disorders characterized by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New peptide conjugates for modulating apoptosis or for inhibiting cell lymphoma/leukemia 2 (Bel-2) function, especially useful for treating neurodesenerative disorders, stroke, or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 18;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   06-APR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         õ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a peptide conjugate having the formula:

(C (R/N) repetide where n = 1-10; X = C-0, when the R-X group is attached to the N-terminus of the peptide, or a side chain of the peptide where c the functional group is peptide, or a side chain of the peptide where side chain of the peptide, or a conversal peptide.

CC side (hain of the peptide, where the side chain functional group is COOH or county; and R ~ 2-18C sixyl group.

CC or county; and R ~ 2-18C sixyl or alkoxy, 2-14C sixylenyl extraining one consubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptide with a 1-5C straight or branched chain sixyl group, or benzyl. The peptide with a 1-5C straight or branched chain alkyl group, or benzyl. The peptide corresponding to amino acide 72-97 of the peptide portion of the conjugate. The peptides represent analogues of the peptide sortion of the coll death agonist Bad. The peptide conjugate is confused the side of the peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for reversing B cell importal televanta? (Bel-2) mediated blockage of subject afflicted with a cancer characterized by cancer cells that corresponding to the conjugate is useful for treating a collect afflicted with a cancer characterized by cancer cells that conjugate is a server afflicted with a cancer characterized by cancer cells that conjugate is a server afflicted with a cancer characterized by cancer cells that conjugate is a server afflicted with a cancer characterized by cancer cells that conjugate is a server afflicted with a cancer characterized by cancer cells that conjugate is a server afflicted with a cancer characterized by cancer cells that conjugate is a server and conjugate is a server and conjugate i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

bcl-x(L)/bcl-2 associated death promoter protein.

```
The present invention describes an isolated or synthetic polypeptide (I) comprising a less than full length andino acid sequence of a mutant CC Enlance: a secolated cell death regulator polypeptide (BAD) or list fragment, which contains amino acid substitutions at Serill 0 of a human CC BAD (Serils of a murine BAD). (I) has immunostimulant, neuroprotective, nootropic, antisischaemic, vulnerary, cytostatic, antiviral, can be used as an apoptosis inducer or inhibitor. BAD plypeptides and can be used as an apoptosis inducer or inhibitor. BAD polypeptides and compounds and can be used as an apoptosis inducer or inhibitor. BAD polypeptides and compounds and drugs of continuous can be used for screening candidate compounds and drugs of continuous can be used for screening candidate compounds and drugs of conducting or inhibiting apoptosis in a cell. Candidate compounds cell survival or apoptosis. Other uses inducting or inhibiting apoptosis in a cell. Candidate compounds conducting or inhibiting apoptosis in a cell candidate compounds conducting or inhibiting apoptosis in a cell candidate compounds conducting or inhibiting apoptosis in a cell candidate compounds conducting or inhibiting apoptosis in a cell candidate compounds conducting or inhibiting apoptosis in a cell candidate compounds conduction or cell death, reperfusion cell death, wound healing, cancer, viral infections, inflammation and cutolimune diseases. The present sequence represents a specifically conduction of conduction and present appears of the present sequence represents a specifically conduction.

Bad is a 22.1 kb protein which interacts with bcl-2 and bcl-x proteins and regulates cell death. It has homology to the bcl-2 related family clustered in the BH1 and BH2 domain. Bad has been found to hybridise to bcl-x(l) and bcl-2 in yeast two-hybrid eastsys and in vivo in mammalian cells. Overexpressed Bad counters the death inhibitory activity of bcl-2. Bad expression can accelerate apoptotic cell death induced by cytokine deprivation in an II-3 dependent cell line expressing bcl-x(L). Bad expression counters the death repressor activity of bcl-x(L). Bad competes with Bax for binding to bcl-x(L). Bad and be used to identify agents which inhibit its binding to bcl-x(L). Bad may be used to identify agents which inhibit its binding to bcl-2 or bcl-x(L) to form heterodiners. Such agents may be used to treat neurodegenerative diseases, immunodeficiency diseases,
                                                                                                                                                                                                                                                                                                                  e.g. AIDS,

The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell clearly regulator) proteins, having an amino acid other than Ser at C death regulator) proteins, having an amino acid other than Ser at C position 112 and/or 136, relative to the murine BAD 204 as sequence. The position in 112 and/or 136, relative to the murine BAD 204 as sequence. The Cream of mutant BAD protein able to decrease cell viability (2) tusion proteins of mutant BAD protein able to decrease cell viability. (2) CC fusion proteins of mutant BAD with a heterologous polypeptide that corprevent diseases associated with reduced apoptosis, e.g. cancer. Inflammation and autoimmune disease. Polypucleotide sequences encoding utant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD creatines phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is caping or ischaemic cell death. The apoptotic status of cells is companied by measuring relative amounts of phosphorylated and non-phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have phosphorylated on the specified Ser, forming a product that does not become companied to the promoting activity than willd-type BAD which can become companied to the proteins in the cytosol, thus promoting cell survival. The mutants with cc ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell C death regulator) proteins, having an amino acid other than Ser at C position 112 and/or 136. relative to the murine BAD 204 as sequence. The position 112 and/or 136. relative to the murine BAD 204 as sequence. The CC present sequence represents a mutant BAD protein. Also described are: (1) CC fusion proteins of mutant BAD protein BAD protein. Also described are: (2) further of the second of the secon
                                                                                                                                                                                                                                                                                                                                                                                   Matches

The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell clearly regulator) proteins, having an maino acid other than Ser at costino 112 and/or 136, relative to the murine BAD 204 as sequence. The position 112 and/or 136, relative to the murine BAD 204 as sequence. The cost increases intracellular delivery. Mutant BAD protein. Also described are: (1) fusion proteins of mutant BAD protein able to decrease cell visbility; (2) fusion proteins of mutant BAD protein BAD by the heterologous polypeptide that increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, cillamation and autoimmune disease. Polymucleotide sequences encoding inflammation and autoimmune disease. Polymucleotide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD can dinhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, can dinhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, cased in treatment of excessive apoptosis such as AIDS, neurodegeneration, cased to excessive apoptosis such as AIDS, neurodegenerati

The CS position 112 and/or 136, relative to the murine BAD 204 as sequence. The CS present sequence represents a mutant BAD protein. Also described are: (1) CC fragments of mutant BAD protein BAD protein. Also described are: (2) fusion proteins of mutant BAD with a heterologous polypeptide that cor prevent diseases associated with reduced apoptosis, e.g. cancer, CC viral infection, lymphoproliferation, arthritis, infertility, CC inflammation and autoimmane disease. Polypubleotide sequences encoding can mutant BAD proteins can be used similarly by gene therapy or to produce transgent animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, can gaing or ischaemic cell death. The apoptotic status of cells is. CC determined by measuring relative amounts of phosphorylated and non-cc phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become complete with BCL-2 or BCL-XL but instead binds to 14-3-3 family compositions in the cytosol, thus promoting a product that does not neterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family compositions to the cytosol, thus promoting activity than wild-type BAD which can become compositions are positions in the cytosol, thus promoting cell survival. The mutants with the composition of the specified ser, forming a product that does not neterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family services and the composition of the specified services of the composition of the composition of the specified services of the composition of the composit
                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (Bcl-X1/Bcl-2 associated cell death regulator). The serine residue is phospory lated in a post-translational modification and allows binding to the 14-3-3 protein which is a signal transduction regulator. Modulators of phosphory lated BAD, which act through inhibition activation of a phosphoserine phosphatase, are useful for preventing/treating increased/decreased apoptosis in a cell. The increased apoptosis may result from immunodeficiency diseases, senesscence, neurodegenerative disease, senesscence, and least transfer in the increased apoptosis may result from immunodeficiency diseases, senesscence, neurodegenerative disease, senesscence, neurodegenerative
                                                                                                                                                                                                                                                                                                                 disease, ischaemic cell death, reperfusion cell death, infertility and wound-healing. Decreased apportosis may result from cancer, viral infection, lymphoproliferative conditions, arthritis, infertility, inflammation and autoimmune diseases. Measuring the amount of phosphorylated and polypeptide and/or total BAD in a cell is useful for determining the apoptotic state of a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Serine-phosphorylated Bcl-X-1/Bcl-2 Associated cell Death regulator polypeptide - useful for modulation of apoptosis associated with,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              represents a novel serine-phosphorylated protein, BAD associated cell death regulator). The serine residue is

                                                                                                                                                                                                                                                                                                                                 Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an isolated or synthetic polypeptide (1) comprising a less than full length makno acid sequence of a mutant CC Sci. XL/Bci. 2 associated cell death regulator polypeptide (BAD) or its fragment, which contains amino acid substitutions at Seril3 of a human EC BAD (Shorter murine BAD). (1) has immunostimulant, neuroprotective, notropic, antiischaemic, vulnerary, cytostatic, antiviral, endough and poptosis inducer or inhibitor. BAD plypeptides and can be used as an apoptosis inducer or inhibitor. BAD plypeptides and polynucleotides can be used for screening candidate compounds and drugs for activity that promote cell survival or apoptosis. Other uses include continuous gor inhibitor, apoptosis in a cell. Candidate compounds continuous gor inhibitor, and poptosis in a cell. Candidate compounds continuous gor inhibitor, and poptosis in a cell. Candidate compounds continuous gor inhibitor, and poptosis in a cell. Candidate compounds continuous gor inhibitor, and poptosis in a cell. Candidate compounds continuous gor inhibitor, and poptosis in a cell. Candidate compounds continuous gor inhibitor, and continuous cell death, reperfusion cell death, wound healing, cancer, viral infections, lymphoproliferative conditions, arthritis, infertility, inflammation and subclammate diseases. The present sequence represents a specifically content of the present content

cc linker to diphtheria toxin translocation domain (DTTR). The functional apoptosis-modifying fusion protein is capable of binding a ct target cell and integrating into or crossing a cellular membrane of the ct target cell. The apoptosis-modifying fusion protein comprises at least two domains: the DTR domain, which targets the fusion protein to the two domains: the DTR domain, which targets the fusion protein to the ctarget cell and the Bcl-XL domain, which modifies an apoptocic response of the target cell. The fusion protein is useful for modifying confidence, neoplasm, macrophage, epitherial, stem, tumour or lymphocyte, cancer, neoplasm, macrophage, epitherial, stem, tumour or hyper-proliferative cell or an adipocyte. It is also useful for reducing apoptosis in a subject after translent ischaenic neuronal injury. The fusion protein may be used to treat various diseases and injury conditions through inhibition or enhancement of apoptotic cellular response, including neurodegenerative disorders such as Alzheimer's disease, Huntington's disease, spinal muscular autophy, stroke episodes and unregulated cell growth as in tumours and effectively throughout the body and targeted to selective tissue and
                                                                                                              Matches

                                                                                                                                                                                                                   The present sequence represents a protein of 166 amino acids. The sequence is disclosed as being a protein called BB06 which regulates cell death through interaction with BC1-2. The DNA may be used for the production of the recombinant protein, which can be used in unspecified therapeutic or diagnostic procedures, as a molecular weight marker, and to raise antibodies that can be used in unspecified diagnostic or therapeutic applications and to reduce or eliminate the biological activity of the BBC6 protein in vivo.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              seq length: 0

binding to Bcl-x(L), Bcl-2 and Bcl-w, thereby affecting the lew of heterodimerization of these proteins with MAX. Con reverse t death repressor activity of Bcl-x(L), but not that of Bcl-2 (B) similarity). Appears to act as a link between growth factor receptor signaling and the apoptoric pathways.

SUBUNIT: Forms heterodimers with the anti-apoptoric protein scolation factor x(L), Bcl-2 and Bcl-w, Also binds protein ScOMA10. The Scr-13/Sesr-137 phosphorylated form binds 14 3-3 proteins. SUBCELLULAR LCCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm (By similarity).

ALTERNATIVE PRODUCTS: 2 isoforms: alpha (shown here) and beta; produced by alternative splicing. They differ only in their Cthe (By

BC1-

are

terminal regions.

TISSUE SPECIFICITY: Expressed in all tissues tested, including brain, liver, spleen and heart. In the brain, restricted to epithelial cells of the choroid plexus. Isoform alpha is the mw more

abundant form.

abundant form.

BAX How There is a domain is required by BIK, BID, BAK, BAD AND BAX How their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bel-2 family.

PMN: Phosphorylated on Ser-113 in response to survival stimuli. Subsequent phosphorylation on Ser-137 promotes heterodimerization with 14·3·3 proteins. This interaction then facilitates the phosphorylation at Ser-156, a site within the BH3 domain, leading to the release of Bel-x(I) and the promotion of cell survival. Ser-137 is the major site of AKT/PKB phosphorylation, Ser-156 the major site of protein kinase A (CAPK) phosphorylation (By SIMILARITY: CONTAINS A BCL-3 HOMOLOGY DOMAIN 3 (BH3). -

BAD OR BBC6 OR BCL318.
-i- FUNCTION. Promotes cell death. Successfully competes for the binding to Bcl-x(L), Bcl-2 and Bcl-w, thereby affecting the level of heterodimerization of these proteins with BAX. Can reverse the death repressor activity of Bcl-X(L), but not that of Bcl-2 (By similarity). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

-i- SUBUNIT: Forms heterodimers with the anti-apoptotic proteins, Bcl-x(L), Bcl-2 and Bcl-w. Also binds protein S100Al0 (By similarity).

The Ser-75/Ser-99 phosphorylated form binds 14-3-3 proteins (By similarity).

-i- SUBCELLULAR LOCATION outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm.

-i- TISSUE SPECIFICITY: EXPRESSED IN A WIDE VARIETY OF TISSUES.

-i- DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.
                                                                                                                                                                                                                                       *Resik S.W.;

   PUNCTION: TURNOLUSIS OF 6-PHOSPHOGLUCONOLACTONE TO 6-PHOSPHOGLUCONATE.

CATALTIC ACTIVITY: 6-phospho-D-glucono-1,5-lactone + phospho-D-gluconate.

PATHWAY: SECOND STEP IN PENTOSE PHOSPHATE PATHWAY.
